Measurement of particle size below 0.06 mm.: 1. Microscopical methods. V. VECERIKOVA, F. STASTKA, AND F. M. KASALAN. *Prace Ústavu Vysoké Využití Polym.* 1955, No. 5, pp. 161-16; abstracted in *J. Appl. Chem. (London)*, 6 [1] i-155 (1956).—Experiments were made to assess the relative merits of the following methods for measuring the particle size of coal and inorganic dusts: (1) enlarging photomicrographs to 24 x 30 cm. and measuring the particles with a paper stencil; (2) measuring the blackening of a photographic plate with a recording photometer; and (3) measuring the particle size on the screen of a projecting microscope. Methods 1 and 3 were equally suitable for practical requirements, but method 3 is cheaper and quicker because it involves no photographic work; it is recommended for the rapid and precise determination of particle sizes <0.06 mm. V.R.R.

TITLE:

Measuring Acceleration

PERIODICAL:

Sdělovací Technika, 1959, Vol 7, Nr 4, pp 133-135
(Czechoslovakia)

ABSTRACT:

Acceleration is a very important mechanical occurrence and the task of measuring it of the greatest significance. Since the requirements of measuring acceleration and its course are various, the article aims to describe the measuring systems and some measuring equipment, consisting of a substance, a spring and eventually, an absorber. A simple instrument is sufficient for measuring the limits of acceleration. More complicated are the instruments and procedures of dynamic measuring. Upon calculating the deviation, the information obtained can be transposed to an electrical signal which is easy to elaborate further on. The most frequently used acceleration meters are described, with special attention paid to their electronic accessories. In order to measure the acceleration ✓

Card 1/2

Measuring Acceleration

CZECH/14-~~9~~4-14/48

tion reliably, it is necessary to gage the instruments and equipment regularly. The gaging is most frequently done on electro-dynamic vibrators. The latter and their capacity are described briefly at the end of the article. There are 10 diagrams, 2 graphs, 2 photographs and 1 table.

TITLE: Measurement of Some Mechanical Values by means of
Piezoelectrical Sensors⁴

PERIODICAL: Strojírenství, 1960, Vol. 10, No. 11,
pp. 849 - 860

TEXT: First, the authors describe the basic principles of piezoelectricity, explaining the physical principles of current methods and briefly discussing the properties of SiO_2 , BaTiO_3 , seignette salt and ADP. Following that, the electric circuit of a sensor is briefly discussed and data are given on electro-metric electron tubes, including data on some Czech and Russian tubes (Table 3, Fig. 11). Accelerometers are dealt with in some detail and so are pressure gauges for measuring the pressures in the combustion spaces of piston engines. Data are included on some commercially available accelerometers produced in Great Britain, USA and Denmark. Data are also given on piezoelectric pressure gauges for measuring the pressures in combustion chambers produced by Brosa and P.E. Klein (West Germany) and SLM (Switzerland). The authors conclude their review by stating

Card 1/2

E073/E335

Measurement of Some Mechanical Values by means of Piezo-electrical Sensors

that the most important application of piezoelectric sensors appears to be for measuring pressures during combustion processes, in rocket research, nuclear physics, during testing of explosives and for accelerometers and piezoelectric vibrators enabling calibration of sensors within a wide frequency range. There are 31 figures, 5 tables and 18 references: 5 Czech, 1 Swiss, 2 English, 4 German and 6 Soviet. /c

TITLE: A method of pressing metallic and ceramic powders for manufacturing machine parts by means of powder metallurgy or other methods

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 19, 1962, 32, abstract 19B174P (Czechosl. Patent cl.49, v.12, no. 99618, of May 15, 1961)

TEXT: A patent is issued for pressing powders with the use of the kinetic energy of particles, speeded up with electric, electromagnetic or other types of accelerator, instead of using static pressure. The design of a device for this purpose is presented. The schematic diagram of the device includes charging device 1, (see figure) and electromagnetic accelerator 2, consisting of a series of selenoids 3. The powder supplied in given portions from charging device 3, is accelerated by periodic current pulses to a definite speed and is delivered to cavity 4 of mold 5. Mold 5 may be fixed, or perform a reciprocating or rotary motion. The described method makes it possible to produce a uniformly pressed part. There is 1 figure.

1881. STYROPOR, THE NEW KIND OF HEAT INSULATION MATERIAL. Stastny, F.
 (Kältetechnik, 1955, vol. 7, 75-78). Styropor is a thermoplastic product
 having a basis of polystyrene and containing a foaming agent. On heating to
 90-110° a porous body of 10-35 times the original volume is produced. The
 porous mouldings of the product have properties highly useful in the
 refrigeration industry, e.g., low thermal conductivity, low water vapour
 diffusion, low water absorption, etc. The two types of product Styropor P and
 K can be rendered non-flammable by coating with mortar, metal foils, water glass,
 etc., and a non-flammable type has also been introduced on the market. The
 application of the product and of the porous mouldings to the refrigeration
 industry is discussed.

TITLE: Development of the central nervous system in pre-natal life [This paper was presented at the Third Interdisciplinary Conference on Experimental and Clinical Study of Higher Nervous Functions held in Marianske Lazne from 19 to 23 October 1964.]

SOURCE: Activitas nervosa superior, v. 7, no. 2, 1965, 122-123

TOPIC TAGS: biologic reproduction, central nervous system, experiment animal, brain, respiratory system, neuron, neurophysiology

ABSTRACT: Three problems were studied: 1. The development of a steady potential of brain hemispheres; this was studied in chick embryos, and it was found that the polarization of the brain hemispheres increased significantly during the second half of incubation. 2. The development of high-frequency impedance of brain tissue. This was studied in guinea pig fetuses; the changes were found to be very complicated. The results were found to be close to those for new-born guinea pigs. 3. The development of activity of respiratory centers. The experiments were made on rats. Only after 21st day of foetus life was it possible to increase the respiratory rate. In young rats recording of activity of bulbar reticular neurons was not successful before the 12th day; at that age response is similar to that of

electrophysiology

ABSTRACT: 76 cerebral fluids and 54 blood sera samples were investigated; pathogenic
changes in the CNS are discussed. Mechanism of the barrier between blood and spinal
fluid is described. The inflammatory fluid syndrome is a pathophysiological phenomenon,
and it is not caused by microorganisms. Increase in lipoproteins, in albumin, and of
haptoglobulins in the fluid is discussed, and the diseases corresponding to these
facts described. Orig. art. has: 9 figures. [JPRS]

1 The effect of sodium hydroxide on human globin. Zdeněk
Vodrážka and Miloš Štastný (Ústav hematologie a Krevní
transfúze, Prague). *Biochem. Listy* 48, 1566-71(1954); cf.
preceding abstr. The method of turbidity curves was used
for following the changes of globin caused by NaOH.
The method is based on the detn. of a pH range over which
the protein is insol. By the action of stronger alkali hydrox-
ide solns., the range of pH at which the protein is pptd.
from the soln. is extended after a certain time.
